

Write a python program to find the second largest element in a list.

```
numbers=[10,20,4,45,99,99,4]
unique_numbers=set(numbers)
unique_list=list(unique_numbers)
unique_list.sort()
if len(unique_list)<2:
    print("the list does not have a second largest element")
else:
    second_largest=unique_list[-2]
    print("the second largest element is:",second_largest)
```

Output:

the second largest element is :45
